

Proactive cybersecurity control and device management

In today's fast-paced world, any device or network that is static is not only old-fashioned, it is potentially prone to cyber threats.

4 ways to mitigate the most common vulnerabilities

- 1 Passwords** – Control privilege levels and manage password of devices. Remember to use strong, unique, passwords and change them on a regular basis
- 2 Firmware** – Use the latest device firmware, as it may include security patches
- 3 HTTPS certificate management** – Manage certificates that enables confidentiality, authentication, and replications
- 4 Hardening guide** – Use the product's hardening guide for the optimum cybersecurity settings

Keep your devices up to date with centralized account, password and certificate management, AXIS Device Manager offers you a tool to both manage your Axis devices as well as effectively implement the security control with 200 times faster than manual work.

Save time. Stay cybersecure.
