Server room protection now with cameras

We've written before about AVTECH's server room monitors, like the Room Alert 11ER, which provide a low cost solution to assist with monitoring server room temperature, humidity and environment in multiple locations.

They've upped the stakes by incorporating AXIS M10 network cameras into the system. Using the Device ManagerR software that comes free with the Room Alert hardware, you can not only monitor changes in your server room but also consolidate the control of these cameras. For example when someone enters the server room, the AXIS cameras can take a picture or stream video, which can be viewed remotely on any PC with the software installed and access to the internet. The same goes for any eventuality that may hit your server room.

The AXIS M10 cameras are low cost yet high quality, with the capabilities of multiple H.264 and motion JPEG streams provided simultaneously. The Device ManagerR software makes it easy to discover all AXIS cameras on the network.
