

AXIS INTRODUCES FIRST PROFESSIONAL VIDEO SERVER SUPPORTING IPV6

[Johannesburg, 29 November 2006] - Axis Communications, the global leader in network video, has announced the AXIS 243SA Video Server, the first one-channel video server that supports Internet Protocol version 6 (IPv6).

IPv6 is the evolutionary Internet upgrade that expands IP addresses from 32- to 128-bits, effectively allowing a massive increase in the available range of Internet addresses.

The AXIS 243SA provides de-interlaced video at full frame rates in both MPEG-4 and MJPEG compressions. It is ideal for installations that require full-motion video, such as casinos, airports, traffic surveillance and prisons.

The video server has integrated two-way audio functionality, which enables users to hear intruders and communicate orders. It supports dome cameras and pan/tilt/zoom cameras through a built-in serial port. The AXIS 243SA also features powerful event-management tools, including video motion detection, pre/post-alarm buffering, and triggered event functionality with alarm notification.

Roy Alves, Country Manager for Axis Communications South Africa, said: "Axis is committed to delivering future-proof network video products, a commitment evidenced by the addition of the market's first IPv6-compatible video server to our already broad video server portfolio. The AXIS 243SA delivers high-quality, full frame rate video, to meet the demands of customers converting from analogue CCTV to digital video in the fast growing IP surveillance market."

The AXIS 243SA is supported by the industry's largest base of application software through the Axis ADP program.
