AXIS P3905-R Mk III Dome Camera
2 MP onboard surveillance

This compact and discreet 2 MP onboard camera complies with rolling stock standards such as EN50155 and EN45545. It can withstand vibrations and a wide range of temperatures. Additionally, with AXIS TP3826-E housing this dome camera can be mounted on the outside of a vehicle. Thanks to Lightfinder and Forensic WDR, it provides details even in challenging light conditions. And with traffic light mode it can distinguish the color of traffic lights in dark scenes. Optional M12 lenses are available to adjust field of view for customized monitoring purposes.

Detect, Observe, Recognize, Identify (DORI)

|	DORI definition	Distance
Detect	25 px/m (8 px/ft)	50.6 m (166.0 ft)
Observe	63 px/m (19 px/ft)	20.1 m (65.9 ft)
Recognize	125 px/m (38 px/ft)	10.1 m (33.1 ft)
Identify	250 px/m (76 px/ft)	5.1 m (16.7 ft)

Axis calculates the DORI values using pixel densities for different use cases as recommended by the EN-62676-4 standard. The calculations use the center of the image as the reference point and consider lens distortion. The possibility to recognize or identify a person or object depends on factors such as object motion, video compression, lighting conditions, and camera focus. Use margins when planning. The pixel density varies across the image, and the calculated values can differ from the distances in the real world.

Key features and technologies

Built-in cybersecurity

Axis Edge Vault

Axis Edge Vault is a hardware component that provides cryptographic storage and cryptographic features to protect the installed Axis device ID from unauthorized use or access. This identity is unique for each product and is designed to prove the origin of the device. Axis device ID is used to implement secure device identification according to IEEE 802.1AR.

Axis Edge Vault is always activated and there are no settings you can change.

Secure boot is a boot process that consists of an unbroken chain of cryptographically validated software, starting in immutable memory (boot ROM). Being based on signed firmware, secure boot ensures that a device can boot only with authorized firmware. Secure boot guarantees that the Axis device is completely clean from possible malware after resetting to factory default.

Signed firmware is implemented by the software vendor signing the firmware image with a private key, which is secret. When firmware has this signature attached to it, a device will validate the firmware before accepting and installing it. If the device detects that the firmware integrity is compromised, it will reject the firmware upgrade. Axis signed firmware is based on the industry-accepted RSA public-key encryption method.

Zipstream

The Axis Zipstream technology preserves all the important forensic in the video stream while lowering bandwidth and storage requirements by an average of 50%. Zipstream also includes three intelligent algorithms, which ensure that relevant forensic information is identified, recorded, and sent in full resolution and frame rate.

Forensic WDR

Axis cameras with wide dynamic range (WDR) technology make the difference between seeing important forensic details clearly and seeing nothing but a blur in challenging light conditions. The difference between the darkest and the brightest spots can spell trouble for image usability and clarity. Forensic WDR effectively reduces visible noise and artifacts to deliver video tuned for maximal forensic usability.

Lightfinder

The Axis Lightfinder technology delivers high-resolution, full-color video with a minimum of motion blur even in near darkness. Because it strips away noise, Lightfinder makes dark areas in a scene visible and captures details in very low light. Cameras with Lightfinder discern color in low light better than the human eye. In surveillance, color may be the critical factor to identify a person, an object, or a vehicle.
